A new operating model for security operations.

Not a traditional MDR. Not an AI SOC tool. Daylight delivers Managed Agentic Security Services (MASS): an AI-native platform and security experts working as one system. AI executes the work at scale, investigating every alert to a verdict. Our security experts, with deep IR, threat hunting, and detection engineering experience, build the infrastructure AI runs on, make judgment calls, and lead response when it matters.

WHO WE ARE

Daylight runs your security operations with an AI-native platform and a follow-the-sun team of security experts with 10+ years of experience. Our experts build the integrations, detections, context, and investigation logic it runs on, validate edge cases, and drive response, so your team moves from firefighting to strategy.

WHY NOW

Security work has outgrown the traditional MDR and MSSP model. Alert volume is exploding, data is distributed across cloud, identity, SaaS, endpoint, and AI systems, and attacks move faster than human-led triage can support. Legacy services escalate what they can't fully resolve. AI SOC tools still leave the operating burden on your team.

Daylight was built to operate this reality: AI execution at machine scale, while senior IR, threat hunting, and detection experts guide the system and own the outcomes.

WHAT WE DELIVER

Three managed agentic services, one architecture

Managed Agentic MDR

A verdict on every alert, not an escalation.

Investigates across endpoint, cloud, identity, AI and SaaS, then closes alerts in your own tools to eliminate backlog. Coverage extends to AI threats, phishing, and DLP.

Managed Agentic Threat Hunting

Continuous hunting, not quarterly reports.

Security experts set the hypotheses; a swarm of AI agents runs them across 90 days of telemetry in parallel, looking for patterns humans would not have time to chase manually.

Agentic Security Data Lake

Long-term telemetry retention and search, without SIEM overhead.

Retains your security telemetry for investigation, hunting, and compliance: 90 days hot, up to 7 years cold. Queried in plain English. No pipelines, parsers, or schemas for your team to own.

HOW IT WORKS

One architecture.
Four layers that work as a single system.

01 Integrations

Connects across security tools, cloud, identity, endpoint, SaaS, email, AI systems, and business context. Adds new sources in days, responds bi-directionally, and closes alerts at the source.

02 Detections

Bring tool alerts, Daylight own detections, and customer rules into one operating layer. Every signal triggers a full investigation, not another queue.

03 Agentic Platform

AI agents collect evidence, correlate context, and investigate across systems end to end. Expert feedback continuously sharpens the logic for each customer environment.

04 Security Experts

Security experts with deep IR, threat hunting, and detection engineering experience build the system, not just supervise it. They handle edge cases, make judgment calls, and lead response when it matters.

AI executes. Experts judge and lead.

Every investigation is evidence-backed, and expert feedback is built back into the platform.

WHY WE'RE DIFFERENT

Structural differences competitors can't bolt on

1

Experts who build the system, not supervise it

Senior detection & response experts with 10+ years in IR and threat hunting. No juniors, no night shifts.

2

Context architecture that compounds

Repositories for telemetry, organizational, and historical context that make every investigation sharper than the last.

3

Near-total coverage, fast

New integrations built in days. Every alert investigated. Your detections, augmented by our proprietary detection library.

4

Reasoning backed by execution

Unlike chatbots that stop at analysis, AIR gathers evidence, validates assumptions, and completes investigations end to end.

5

Auditable and explainable

Every step is visible - data, context, reasoning, verdict - and written back to your source tool.

Gartner Peer Insights™

★★★★★

Exceptional MDR Service with Superior Threat Detection and Expert Analysis - Highly recommended for organizations seeking enterprise-grade security without internal soc investment

— Manager, IT Security and Risk Management in the Transportation Industry

Company size
3B - 10B USD

Gartner Peer Insights™

★★★★★

Agentic AI Enables to replicate the top IR people skills, providing Deeper Investigations at Scale Compared To Traditional MDR Surface Analysis

— Chief Information Security Officer in the Finance (non-banking) Industry

Company size
500M - 1B USD
